

Retain the code elements in the current license procurement. It is a tradition and an aspect that keeps amateur radio unique. I will probably never build an electrical kit, yet I had to learn some basic electrical theory, and it was good that I did. If a license is desired, rules must be in place that covers all aspects of amateur radio. RM-10809 is part of an agenda to eventually eliminate code all together. If this is accomplished, the next barrier would be to eliminate some of the technical questions, and the final frontier would be to let anyone with a radio transmit. Let's continue with the required code element. It is already dumbed down. Keep amateur radio unique and above board, a prividege for those who want to spend time to earn the right to use these worldwide frequencies.
